

Name : Sayyad Danish

Q.1 Str1 = "Hello World"
print(Str1.reverse()) (1)

Q.2 Str1 = "A Quick Brown Fox Jump over the
lazy Dog"
print(len(Str1)) (1)

Q.84 Difference Between List and Set :

List	Set (1)
• Ordered ✓	• unordered ✓
• Mutable ✓	• Mutable ✓
• <u>Unhashable</u> ✓	• <u>unhashable</u> ✓
• Define using [] ✓	• Define using { } { }

Q.5 Set Can not contain list because Set has no index value (1)

Q.6 Because Sets are unordered and we can not add, remove, elements in set. and it stores only unique value.
• Note: we can remove and not like list

Q.7 Difference Between Remove and Discard() :

remove() is use remove the value

Discard() will not remove or delete the value it will discard it

Name: Sayyad Danish

Q.1 Str1 = "Hello World"
print(Str1.reverse()) (1)

Q.2 Str1 = "A Quick Brown Fox Jump over the
lazy Dog"
print(len(Str1)) (1)

Q.84 Difference Between List and Set :

List	Set (1)
• Ordered ✓ • Mutable ✓ • <u>Unhashable</u> ✓ • Define using <code>[]</code> ✓	• unordered ✓ • Mutable ✓ • <u>unhashable</u> ✓ • Define using <code>[]</code> <code>{ }</code> ✓

Q.5 Set can not contain list because Set has no index value. (1)

Q.6 Because Sets are unordered and we can not add, remove, elements in set. and it stores only unique value.
• Note: We can remove and not like list

Q.7 Difference Between Remove and Discard() :

remove() is use remove the value

Discard() will not remove or delete the value it will discard it

Remove

it takes value as a parameter and then remove the value

example:

~~lst1 = [10, 20, 30]~~

~~lst1.remove(20)~~

~~# it will remove 20~~

→

discard

it remove last value

example:

~~lst1 = [10, 20, 30]~~

~~lst1.discard()~~

~~# it will remove last value~~

Q.8 There are total four Methods to insert element in a list

- ① Insert()
- ② Append()
- ③ extend()
- ④ update()

Merge

Q.9 There are total ~~six~~ ^{five} Methods.

- ① remove()
- ② pop(n)
- ③ pop()
- ④ del()
- ⑤ discard()

Q.11 precedence rule in python (arithmetic)

— Ascending Order:

Highest

Lowest

① ()

② /

③ *

④ +

⑤ -

Q. 12

List 1 = [5, 11, 14, 7, 8, 2, 5, 9] (1)

~~list 1~~ print(List1.sort()) # Ascending order

print(List1.sort(reverse = True)) # Descending

Q. 13

Dictionary:

A Dictionary is a pair of of Key and value

Methods to create Dictionary

- ① using { } curly braces
- ② using dict()

(1)

Example of Dictionary

Dict1 = { "a": 22, "b": 24 }

Key → "a" value → 22

Separator (colon) → :

Which is use to assign value

Q. 14

- ① using { } curly braces
- ② using dict() Constructor.

(1)

Example:

① Dict1 = { "b": 42, "c": 31 }

② dict ([a = 24, b = 32])

Q. 14.

Q. 15.

① pop(a)

② pop(n)

③ del()

④ remove()

key

popItems() → (a, 1)

①

Q. 18.

packing :

packing is a method to ~~put~~ in which elements
stored in a single variable.

example : Data = (32, 34, 36)

①

Q. 19.

unpacking :

it is a method of assigning value to variable
like...

Data = [32, 34, 36]

Data = ["Danish", 21, "python"]

Name, age, Course = Data

①

Q. 20

set and Dictionary

Set

- Contain unique values
- Comma (,) separated value
- { }

Dictionary

- it has key value pair
- declare using dict {}
- { }

①
